 Critical Care 2008, 12(Suppl 2):P1 (doi:10.1186/s13053-013-0022-2)

**Introduction:** In order to find out the frequency rates of domestic and wild animal bites as well as the evaluation of the prevalence rates of rabies disease in the human population in the Province of Kerman, a retrospective study was designed to analyze statistically the collected recorded data related to this topic.  
**Methods:** This study was conducted within the framework of MPH student research projects by means of collaboration between University of Tabriz, Veterinary Organization of Kerman, Medical Science University of Kerman and Medical Science University of Rahbaran and Networks of Health Centers of the 10 cities of Kerman Province.  
 The required data such as the numbers of persons who were bitten by animals, the distribution of the studied variables such as geographical locations, age groups of people, jobs and professional relationships, pre-exposure prophylaxis treatment for rabies, and topographical conditions of the injured organs of bodies due to the animal bites, as well as the mortality rates of individuals resulting from rabies were collected during one decade from 21 March 1994 to 31 March 2003 in all 10 cities including the rural areas of the province of Kerman. All data were finally analyzed by SPSS software (version 11.5).  
**Results:** On the basis of recorded statistical analysis, the mortality rates of human rabies in the province of Kerman during one decade was 10 persons (eight males and two females). One half of them (50%) were bitten by dogs and the others (50%) by cats. Among the reported deaths, 40% were from Kohgiluyeh county (South region). The reported data indicated that 21,548 persons were bitten by animals during 10 years in the province of Kerman. The mean age of the people who were bitten by dogs was 24.80 years (SD = 8.14), while the mean age of the people who were bitten by cats was 37.25 years (SD = 8.14). There was a significant difference between the mean age of these two groups of the people ( $P < 0.05$ ). The most frequent rate of injured people was reported in the age group 10–19 years old and the frequency rate of males (76.00%) was more than females (24.00%). Therefore, there was a statistically significant difference between males and females in this study ( $P < 0.05$ ). About 60% of all persons that were bitten by animals during one decade in the province of Kerman, 85.70% of them were not treated by the rabies prophylaxis treatment regimen. Among all of them who were bitten by animals, 50% were injured through hands and feet, 40%

of them through heads and faces, and 10% of them through trunks, cervical regions and other organs of the bodies. In the persons who were bitten by animals in the head region, the mean latency period for rabies was 33 days (SD = 81.2 days), while the mean latency period in the persons who were bitten through hands and feet was 77 days (SD = 84.8 days). The  $P$  value was  $< 0.05$ . The results of this study showed that there is a significant reciprocal correlation between annual raining level and the frequency rate of animal bites in the province of Kerman ( $r = 0.5$ ,  $P < 0.05$ ).

**Conclusions:** According to this study, the role of bites in the epidemiology of human rabies in the province of Kerman, located in the southeast of Iran, seems very important. Since most of the animal bite individuals, during the one-decade survey in this region, did not seem aware of the risk of exposure to the viral infection of rabies through animal bites, the public education of preventive measurements of rabies seems imperative by the public health authorities as well as vaccination of animals against rabies, especially dogs and cats, as well as mass vaccination of wild animals by means of distribution of oral vaccines in the vast and scattered forests by helicopters, belonging to Veterinary Organization Authorities being recommended. Collaboration of intersectoral public health relationships of medical science universities of the province of Kerman as well as all related authorities to control rabies prevalence in the regional and inter-regional provinces of the southeast, the southwest and the neighbor provinces of Fars, Hormozgan, Bostan Abadestan and Yazd is very necessary.

**P2 What do people really know about MRSA? A survey of knowledge and attitudes in the general public and hospital visitors**

**A McLaughlin, J Conway, E Mulcahy, R Mulcahy, H Shee, J Ward, K Gorman, G Fitzpatrick, M Donnelly**  
 Ashlough Health Hospital, Dublin, Ireland  
 Critical Care 2008, 12(Suppl 2):P2 (doi:10.1186/s13053-013-0022-2)

**Introduction:** We set out to assess current understanding of MRSA among the lay public prior to writing an information booklet for relatives of patients in the ICU.  
**Methods:** Titled researchers approached potential participants in the hospital entrance and public places to complete the questionnaire.  
**Results:** Of 545 participants who completed the questionnaire, 24 had never heard of MRSA and 521 remained (976 visitors, 345 general public). 4.9% ( $n = 26$ ) had previously contracted MRSA. The median age was 37 (21–89) years. The cohort had heard of MRSA 24 (4.4%) months previously. The most common source of information was television and newspapers. Participants who had MRSA thought that the absence of beds contributed to MRSA
